

Waddles / Logs

EROSION CONTROL

Benefits:

Straw Logs for Sediment & Erosion Control. Soil Erosion can be a serious problem, resulting in damage to water sources and in some cases the failure of the slope resulting in landslides. Repairing these damages can be difficult time consuming and expensive.

Benefits of Master Gardner's Straw Logs are cost, speed of installation, longevity. Straw Logs help stabilize the slope by checking water flow reducing soil loss. These sediment and flow control logs are installed in channels or on slopes and can be extremely effective to capture sediment at a single location or to protect a culvert or drain.

Logs should be 'staked' in place every 2' to 3' depending on slope and or expected water flow and inspected to insure continued structural integrity and performance.
