

Jute Mesh

EROSION CONTROL

Open Mesh Jute is the most cost effective solution to slope and culverts erosion. Soil Erosion can be a serious problem, resulting in damage to water sources and in some cases the failure of the slope resulting in landslides. Repairing these damages can be difficult time consuming and expensive.

Geo-Jute helps stabilize the slope preventing soil loss due to rain, and wind and creates an ideal condition for maximum seed germination with the quick establishment of vegetation aided by Geo-Jute High moisture absorption, up to five times (5x) its own weight and will last for about one (1) year. Geo-Jute should be installed over a properly prepared, fertilized and seeded area. Make sure the 'mesh' is in contact with the soil over the entire area and secured with PRO-Pins™ every 2' horizontally and 3' vertically.
