

## Silt Fence

### EROSION CONTROL

Silt Fence is a sediment control fabric designed to impede silt run-off and prevent top soil from washing away from construction sites and fouling ponds & streams. The Tough durable fence is constructed of woven slit film polypropylene fabric and comes with pre-sharpened hardwood stakes attached. Installation is quick and easy, unroll the fence in the desired area and hammer stakes into the ground; make sure the bottom three (3") of fabric is laying flat and then anchor this portion into the soil with fabric pins/ sod staples and cover with soil to prevent water from running under the fabric.
