

## Driveways & Access Roads

Use of a 'landscape fabric' (geotextile) under a Driveway or access road provides separation of the aggregate from the subsoil and reinforces the foundation soil reducing frost heaves and dislocation of the pavers, brick or stone. For a Driveway/Access Road fabric underliner to perform effectively in soil stabilization and sub base applications, the product must be able to transfer its strength to the soil (below) and aggregate (above) while maintaining its reinforcing characteristics throughout the expected life of the project.

The use of Master Gardner's Driveway liners eliminates the progressive upward migration of the subsoil, which would contaminate the aggregate with resultant loss of the support capability. While selection of fabric is determined based on the soils load-bearing capacity and the amount of aggregate intended to be used Master Gardner Company suggest Polytex NP, ProWeave or YardTex PRO for very light duty application.

*Note: The application of this product is most effective on sand or fine aggregate based systems.*
